DESCRIPTION

The LD1117 is a LOW DROP Voltage Regulator able to provide up to 800mA of Output Current, available even in adjustable version ($V_{ref}=1.25V$). Concerning fixed versions, are offered the following Output Voltages: 1.2V, 1.8V, 2.5V, 2.85V, 3.0V, 3.3V and 5.0V. The 2.85V type is ideal for SCSI-2 lines active termination. The device is supplied in: SOT-223, DPAK, SO-8 and TO-220. The SOT-223 and DPAK surface mount packages optimize the thermal characteristics even offering a relevant space saving effect. High efficiency is assured by NPN pass transistor. In fact in this

case, unlike than PNP one, the Quiescent Current flows mostly into the load. Only a very common 10 μ F minimum capacitor is needed for stability. On chip trimming allows the regulator to reach a very tight output voltage tolerance, within $\pm 1\%$ at 25°C. The ADJUSTABLE LD1117 is pin to pin compatible with the other standard. Adjustable voltage regulators maintaining the better performances in terms of Drop and Tolerance.

Table 2: Absolute Maximum Ratings

Symbol	Parameter		Value	Unit
V_{IN}	DC Input Voltage		15	V
P_{tot}	Power Dissipation		12	W
T_{stg}	Storage Temperature Range		-40 to +150	°C

**LD1117 ADJUSTABLE: APPLICATION NOTE**

The LD1117 ADJUSTABLE has a thermal stabilized $1.25 \pm 0.012V$ reference voltage between the OUT and ADJ pins. I_{ADJ} is 60 μA typ. (120 μA max.) and ΔI_{ADJ} is 1 μA typ. (5 μA max.). R_1 is normally fixed to 120 Ω . From figure 11 we obtain:

$$V_{OUT} = V_{REF} + R_2 (I_{ADJ} + I_{R1}) = V_{REF} + R_2 (I_{ADJ} + V_{REF} / R_1) = V_{REF} (1 + R_2 / R_1) + R_2 \times I_{ADJ}$$

In normal application R_2 value is in the range of few kohm, so the $R_2 \times I_{DJ}$ product could not be considered in the V_{OUT} calculation; then the above expression becomes:

$$V_{OUT} = V_{REF} (1 + R_2 / R_1).$$

In order to have the better load regulation it is important to realize a good Kelvin connection of R_1 and R_2 resistors. In particular R_1 connection must be realized very close to OUT and ADJ pin, while R_2 ground connection must be placed as near as possible to the negative Load pin. Ripple rejection can be improved by introducing a 10 μF electrolytic capacitor placed in parallel to the R_2 resistor (see Fig. 12).
